

# **6** FUNCTIONS

- Function, Domain, Co-domain, Range
- Types of functions
- Representation of function
- Basic types of functions
- Piece-wise defined and special functions

#### 6.1 Function

**Definition**: A function (or mapping) f from a set A to set B  $(f: A \rightarrow B)$  is a relation which associates for each element x in A, a unique (exactly one) element y in B.

Then the element y is expressed as y = f(x).

y is the image of x under f.

f is also called a map or transformation.

If such a function exists, then A is called the **domain** of f and B is called the **co-domain** of f.

#### **Illustration:**

Examine the following relations which are given by arrows of line segments joining elements in A and elements in B.

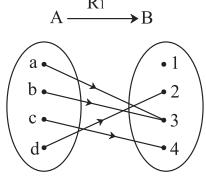

Fig. 6.1

Since, every element from A is associated to exactly one element in B, R<sub>1</sub> is a well defined function.

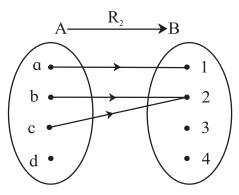

Fig. 6.2

R<sub>2</sub> is not a function because element 'd' in A is not associated to any element in B.

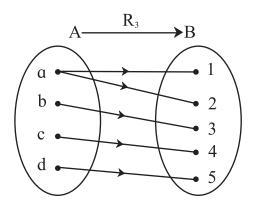

Fig. 6.3

 $R_3$  is not a function because element a in A is associated to two elements in B.

The relation which defines a function f from domain A to co-domain B is often given by an algebraic rule.

For example, A = Z, the set of integers and B = Q the set of rational numbers and the function f is given by  $f(n) = \frac{n}{7}$  here  $n \in \mathbb{Z}$ ,  $f(n) \in \mathbb{Q}$ .

## 6.1.1 Types of function

## One-one or One to one or Injective function

**Definition**: A function  $f: A \rightarrow B$  is said to be one-one if different elements in A have different images in B. The condition is also expressed as

$$f(a) = f(b) \implies a = b$$
 [As  $a \neq b \implies f(a) \neq f(b)$ ]

## Onto or Surjective function

**Definition:** A function  $f: A \rightarrow B$  is said to be onto if every element y in B is an image of some x in A (or y in B has preimage x in A)

The image of A can be denoted by f(A).

$$f(A) = \{ y \in B \mid y = f(x) \text{ for some } x \in A \}$$

f(A) is also called the **range** of f.

Note that  $f: A \rightarrow B$  is onto if f(A) = B.

Also range of  $f = f(A) \subset \text{co-domain of } f$ .

#### **Illustration:**

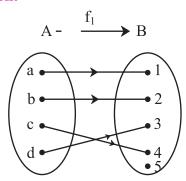

Fig. 6.4

f<sub>1</sub> is one-one, but not onto as element 5 is in B has no pre image in A

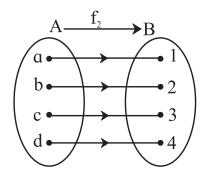

Fig. 6.5

f, is one-one, and onto

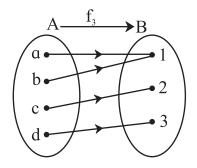

Fig. 6.6

 $f_3$  is onto but not one-one as f(a) = f(b) = 1but  $a \neq b$ .

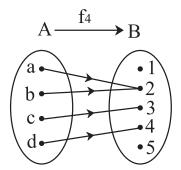

Fig. 6.7

 $f_{\perp}$  is neither one-one, nor onto

## 6.1.2 Representation of Function

Verbal	Output exceeds twice the input by 1		
form	Domain: Set of inputs		
	Range: Set of outputs		
Arrow form on Venn Diagram	Fig. 6.8  Domain: Set of pre-images Range: Set of images		
Ordered	$f = \{(2,5), (3,7), (4,9), (5,11)\}$		
Pair	Domain: Set of 1 <sup>st</sup> components from		
(x, y)	each ordered pair = $\{2, 3, 4, 5\}$		
	Range: Set of 2 <sup>nd</sup> components from		
	each ordered pair = $\{5, 7, 9, 11\}$		

Rule / Formula	y = f(x) = 2x + 1 Where $x \in N$ , $1 < x < 6$ f(x) read as 'f of x' or 'function of x' Domain: Set of values of x for which $f(x)$ is defined Range: Set of values of y for which f(x) is defined		
Tabular Form	x         y           2         5           3         7           4         9           5         11           Domain: x values		
Graphical form	Range: y values  (5, 11)  (4, 9)  (3, 7)		
	$ \begin{array}{cccccccccccccccccccccccccccccccccccc$		
	Fig. 6.9  Domain: Projection of graph on <i>x</i> -axis.  Range: Projection of graph on <i>y</i> -axis.		

## 6.1.3 Graph of a function:

If the domain of function is in R, we can show the function by a graph in xy plane. The graph consists of points (x,y), where y = f(x).

#### **Vertical Line Test**

Given a graph, let us find if the graph represents a function of x i.e. f(x)

A graph represents function of x, only if no vertical line intersects the curve in more than one point.

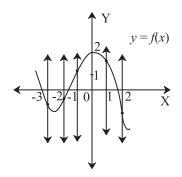

Fig. 6.10

Since every *x* has a unique associated value of *y*. It is a function.

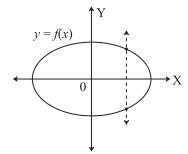

Fig. 6.11

This graph does not represent a function as vertical line intersects at more than one point some x has more than one values of y.

#### **Horizontal Line Test:**

If no horizontal line intersects the graph of a function in more than one point, then the function is one-one function.

#### **Illustration:**

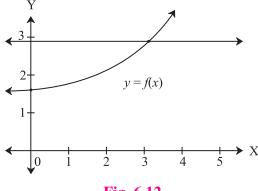

Fig. 6.12

The graph is a one-one function as a horizontal line intersects the graph at only one point.

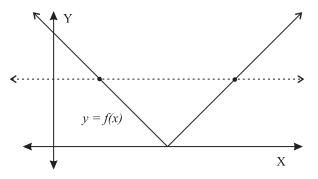

Fig. 6.13

The graph is a one-one function

**6.1.4 Value of funcation :** f(a) is called the value of funcation f(x) at x = a

#### **Evaluation of function:**

**Ex. 1)** Evaluate  $f(x) = 2x^2 - 3x + 4$  at

$$x = 7 \& x = -2t$$

**Solution**: f(x) at x = 7 is f(7)

$$f(7) = 2(7)^{2} - 3(7) + 4$$
$$= 2(49) - 21 + 4$$
$$= 98 - 21 + 4$$
$$= 81$$

$$f(-2t) = 2(-2t)^2 - 3(-2t) + 4$$
$$= 2(4t^2) + 6t + 4$$
$$= 8t^2 + 6t + 4$$

**Ex. 2)** Using the graph of y = g(x), find g(-4)and g(3)

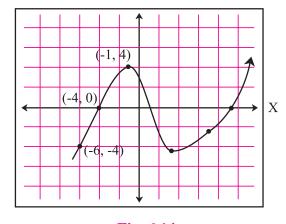

Fig. 6.14

**Solution :** From graph when x = -4, y = 0so g(-4) = 0

From graph when x = 3, y = -5 so g(3) = -5

#### **Function Solution:**

**Ex. 3**) If  $t(m) = 3m^2 - m$  and t(m) = 4, then find m

**Solution**: As

$$t(m) = 4$$

$$3m^2 - m = 4$$

$$3m^2 - m - 4 = 0$$

$$3m^2 - 4m + 3m - 4 = 0$$

$$m(3m-4)+1(3m-4)=0$$

$$(3m-4)(m+1)=0$$

Therefore,  $m = \frac{4}{3}$  or m = -1

Ex. 4) From the graph below find x for which f(x) = 4

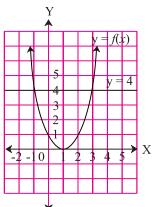

Fig. 6.15

**Solution :** To solve f(x) = 4 i.e. y = 4

Find the values of x where graph intersects line y = 4

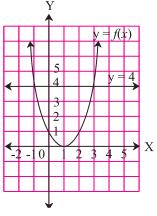

Fig. 6.16

Therefore, x = -1 and x = 3.

## **Function from equation:**

Ex. 5) (Activity) From the equation 4x + 7y = 1express

- y as a function of x i)
- ii) x as a function of y

**Solution :** Given equation is 4x + 7y = 1

From the given equation

$$7y =$$

 $y = \square = \text{function of } x$ 

So y = f(x) =

ii) From the given equation

$$4x =$$

x = = function of y

So x = g(y) =

#### **6.1.5 Some Basic Functions**

(Here  $f: R \to R$  Unless stated otherwise)

## 1) Constant Function

Form: f(x) = k,  $k \in R$ 

**Example :** Graph of f(x) = 2

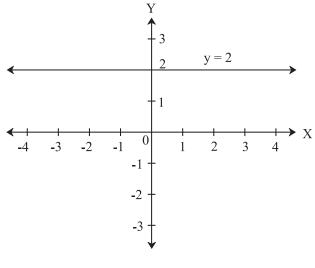

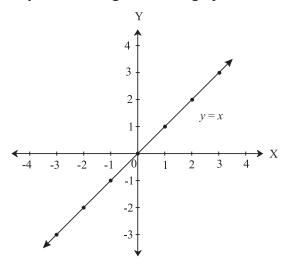

Fig. 6.17

**Domain**: R or  $(-\infty, \infty)$  and **Range**: {2}

## 2) Identity function

If  $f: \mathbb{R} \to \mathbb{R}$  then identity function is defined by f(x) = x, for every  $x \in R$ .

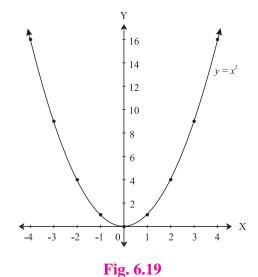

Identity function is given in the graph below.

**Fig. 6.18** 

**Domain :** R or  $(-\infty, \infty)$  and **Range :** R or  $(-\infty, \infty)$ [Note: Identity function is also given by I(x) = x].

- **3)** Power Functions:  $f(x) = ax^n$ ,  $n \in N$ (Note that this function is a multiple of n<sup>th</sup> power of x)
- **Square Function Example :**  $f(x) = x^2$

**Domain :** R or  $(-\infty, \infty)$  and **Range :**  $[0, \infty)$ 

## **Properties:**

- 1) Graph of  $f(x) = x^2$  is a parabola opening upwards and with vertex at origin.
- 2) Graph is symmetric about y axis.
- 3) The graph of even powers of x looks similar to square function. (verify !) e.g.  $x^4$ ,  $x^6$ .
- 4)  $(y k) = (x h)^2$  represents parabola with vertex at (h, k)
- 5) If  $-2 \le x \le 2$  then  $0 \le x^2 \le 4$  (see fig.) and if  $-3 \le x \le 2$  then  $0 \le x^2 \le 9$  (see fig).

## ii) Cube Function

**Example :**  $f(x) = x^3$ 

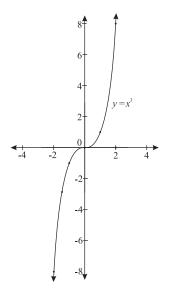

Fig. 6.20

**Domain :** R or  $(-\infty, \infty)$  and **Range :** R or  $(-\infty, \infty)$ 

## **Properties:**

- 1) The graph of odd powers of x (more than 1) looks similar to cube function. e.g.  $x^5$ ,  $x^7$ .
- 4) Polynomial Function

$$f(x) = a_0 x^n + a_1 x^{n-1} + \dots + a_{n-1} x + a_n$$

is polynomial function of degree n, if  $a_0 \neq 0$ , and  $a_i$  s are real.

#### i) Linear Function

**Form** :  $f(x) = ax + b \ (a \ne 0)$ 

**Example :**  $f(x) = -2x + 3, x \in R$ 

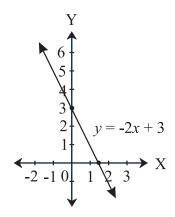

Fig. 6.21

**Domain :** R or  $(-\infty, \infty)$  and **Range :** R or  $(-\infty, \infty)$ 

## **Properties:**

- 1) Graph of f(x) = ax + b is a line with slope 'a', y-intercept 'b' and x-intercept  $\left(-\frac{b}{a}\right)$ .
- 2) Function: is increasing when slope is positive and deceasing when slope is negative.

#### ii) Quadratic Function

**Form**:  $f(x) = ax^2 + bx + c \ (a \neq 0)$ 

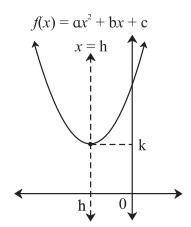

Fig. 6.22

**Domain :** R or  $(-\infty, \infty)$  and **Range :**  $[k, \infty)$ 

#### **Properties:**

1) Graph of  $f(x) = ax^2 + bx + c$  and where a > 0 is a parabola.

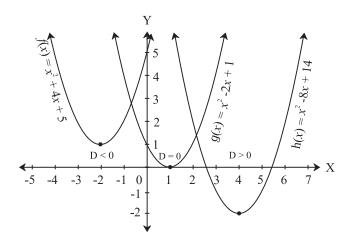

Fig. 6.23

Consider, 
$$y = ax^2 + bx + c$$
  

$$= a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) + c - \frac{b^2}{4a}$$

$$= a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}$$

$$\left(y + \frac{b^2 - 4ac}{4a}\right) = a\left(x + \frac{b}{2a}\right)^2$$

With change of variable

$$X = x + \frac{b}{2a}, Y = y + \frac{b^2 - 4ac}{4a}$$

this is a parabola  $Y = aX^2$ 

This is a parabola with vertex

$$\left(-\frac{b}{2a}, \frac{b^2-4ac}{4a}\right)$$
 or  $\left(\frac{-b}{2a}, \frac{-D}{4a}\right)$  where

 $D = b^2 - 4ac$  and the parabola is opening upwards. There are three possibilities.

For a>0,

- i) If  $D = b^2 4ac = 0$ , the parabola touches x-axis and  $y \ge 0$  for all x. e.g.  $g(x) = x^2 2x + 1$
- ii) If  $D = b^2 4ac > 0$ , then parabola intersects x-axis at 2 distinct points. Here y is negative for values of x between the 2 roots and positive for large or small x.

iii) If  $D = b^2 - 4ac < 0$ , the parabola lies above x-axis and  $y \ne 0$  for any x. Here y is positive for all values of x. e.g.  $f(x) = x^2 + 4x + 5$ 

## iii) Cubic Function

**Example :**  $f(x) = ax^3 + bx^2 + cx + d \ (a \neq 0)$ 

**Domain**: R or  $(-\infty, \infty)$  and

**Range:** R or  $(-\infty, \infty)$ 

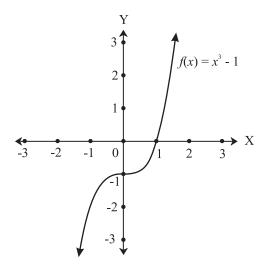

Fig. 6.24

## **Property:**

1) Graph of  $f(x) = x^3 - 1$ 

 $f(x) = (x - 1)(x^2 + x + 1)$  cuts x-axis at only one point (1,0), which means f(x) has one real root & two complex roots.

Note that, any polynomial of odd degree must have at least one real root, because the complex roots appear in conjugate pairs.

## 5) Radical Function

**Ex:** 
$$f(x) = \sqrt[n]{x}$$
,  $n \in \mathbb{N}$ 

#### 1. Square root function

$$f(x) = \sqrt{x}, x \ge 0$$

(Since square root of negative number is not a real number, so the domain of  $\sqrt{x}$  is restricted to positive values of x).

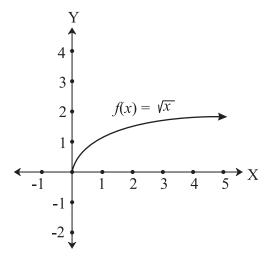

Fig. 6.25

**Domain**:  $[0, \infty)$  and **Range**:  $[0, \infty)$ 

#### Note:

- 1) If x is positive, there are two square roots of x. By convention  $\sqrt{x}$  is positive root and  $-\sqrt{x}$  is the negattive root.
- 2) If -4 < x < 9, as  $\sqrt{x}$  is only deifned for  $x \ge 0$ , so  $0 \le \sqrt{x} < 3$ .

Ex. 6: Find the domain and range of  $f(x) = \sqrt{9-x^2}$ .

**Soln.**: 
$$f(x) = \sqrt{9 - x^2}$$
 is defined for  $9 - x^2 \ge 0$ , i.e.  $x^2 - 9 \le 0$  i.e.  $(x - 3)(x + 3) \le 0$ 

Therefore [-3, 3] is domain of f(x). (Verify!)

To find range, let  $\sqrt{9-x^2} = y$ 

Since square root is always positive, so  $y \ge 0$  ...(I)

Also, on squaring we get  $9 - x^2 = y^2$ 

Since,  $-3 \le x \le 3$ 

i.e.  $0 \le x^2 \le 9$ 

i.e.  $0 \ge -x^2 \ge -9$ 

i.e.  $9 \ge 9 - x^2 \ge 9 - 9$ 

i.e. 
$$9 \ge 9 - x^2 \ge 0$$

i.e. 
$$3 \ge \sqrt{9 - x^2} \ge 0$$

$$\therefore 3 \ge y \ge 0 \qquad \dots (II)$$

From (I) and (II),  $y \in [0,3]$  is range of f(x).

## 2. Cube root function

$$f(x) = \sqrt[3]{x} ,$$

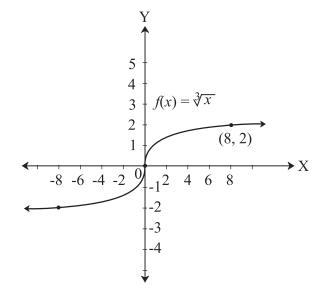

Fig. 6.26

**Domain:** R and **Range:** R

**Note:** If  $-8 \le x \le 1$  then  $-2 \le \sqrt[3]{x} \le 1$ .

**Ex. 7:** Find the domain  $f(x) = \sqrt{x^3 - 8}$ .

**Soln.**: f(x) is defined for  $x^3 - 8 \ge 0$ 

i.e. 
$$x^3 - 2^3 \ge 0$$
,  $(x - 2)(x^2 + 2x + 4) \ge 0$ 

In 
$$x^2 + 2x + 4$$
,  $a = 1 > 0$  and  $D = b^2 - 4ac$   
=  $2^2 - 4 \times 1 \times 4 = -12 < 0$ 

Therefore,  $x^2 + 2x + 4$  is a positive quadratic.

i. e.  $x^2 + 2x + 4 > 0$  for all x

Therefore  $x - 2 \ge 0$ ,  $x \ge 2$  is the domain.

i.e. Domain is  $x \in [2, \infty)$ 

#### **6) Rational Function**

**Definition:** Given polynomials

p(x),  $q(x) f(x) = \frac{p(x)}{q(x)}$  is defined for x if  $q(x) \neq 0$ .

**Example :**  $f(x) = \frac{1}{x}$ ,  $x \neq 0$ 

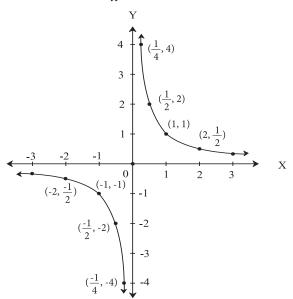

Fig. 6.27

**Domain :**  $R - \{0\}$  and **Range :**  $R - \{0\}$ 

## **Properties:**

- 1) As  $x \to 0$  i.e. (As x approaches 0)  $f(x) \to \infty$  or  $f(x) \to -\infty$ , so the line x = 0 i.e y-axis is called vertical asymptote.( A straight line which does not intersect the curve but as x approaches to  $\infty$  or  $-\infty$  the distance between the line and the curve tends to 0, is called an asymptote of the curve.)
- 2) As As  $x \to \infty$  or  $x \to -\infty$ ,  $f(x) \to 0$ , y = 0 the line i.e y-axis is called horizontal asymptote.
- 3) The domain of rational function  $f(x) = \frac{p(x)}{q(x)}$  is all the real values of except the zeroes of q(x).

Ex. 8: Find domain and range of the function

$$f(x) = \frac{6 - 4x^2}{4x + 5}$$

**Solution :** f(x) is defined for all  $x \in R$  except when denominators is 0.

Since, 
$$4x + 5 = 0 \Rightarrow x = -\frac{5}{4}$$
.

So Domain of 
$$f(x)$$
 is  $R - \left\{-\frac{5}{4}\right\}$ .

To find the range, let 
$$y = \frac{6-4x^2}{4x+5}$$

i.e. 
$$y(4x + 5) = 6 - 4x^2$$

i.e. 
$$4x^2 + (4y)x + 5y - 6 = 0$$
.

This is a quadratic equation in x with y as constant.

Since  $x \in R - \{-5/4\}$ , i.e. x is real, we get

Solution if, 
$$D = b^2 - 4ac \ge 0$$

i.e. 
$$(4y)^2 - 4(4)(5y - 6) \ge 0$$

$$16y^2 - 16(5y - 6) \ge 0$$

$$v^2 - 5v + 6 \ge 0$$

$$(y-2)(y-3) \ge 0$$

Therefore  $y \le 2$  or  $y \ge 3$  (Verify!)

Range of 
$$f(x)$$
 is  $(-\infty, 2] \cup [3, \infty)$ 

## 7) Exponential Function

**Form :**  $f(x) = a^x$  is an exponential function with base a and exponent (or index) x,  $a \ne 0$ ,

$$a > 0$$
 and  $x \in R$ .

**Example :** 
$$f(x) = 2^x$$
 and  $f(x) = 2^{-x}$ 

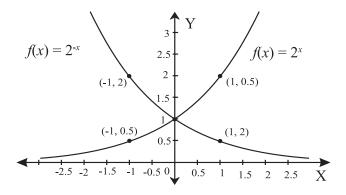

Fig. 6.28

**Domain:** R and Range:  $(0, \infty)$ 

## **Properties:**

- 1) As  $x \to -\infty$ , then  $f(x) = 2^x \to 0$ , so the graph has horizontal asymptote (y = 0)
- By taking the natural base  $e \approx 2.718$ , 2) graph of  $f(x) = e^x$  is similar to that of  $2^x$  in appearance

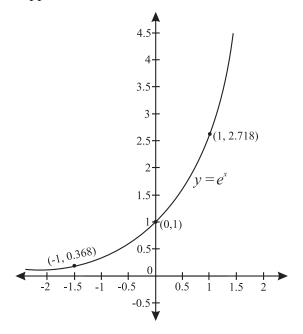

Fig. 6.29

- 3) For a > 0,  $a \ne 1$ , if  $a^x = a^y$  then x = y. So  $a^x$  is one-one function. (check graph for horizontal line test).
- 4) r > 1,  $m > n \Rightarrow r^m > r^n$  and  $r < 1, m > n \Longrightarrow r^m < r^n$

**Ex. 9**: Solve  $5^{2x+7} = 125$ .

**Solution**: As  $5^{2x+7} = 125$ 

i.e: 
$$5^{2x+7} = 5^3$$
,  $\therefore 2x + 7 = 3$ 

and 
$$x = \frac{3-7}{2} = \frac{-4}{2} = -2$$

**Ex. 10**: Find the domain of  $f(x) = \sqrt{6 - 2^x - 2^{3-x}}$ 

**Solution**: Since  $\sqrt{x}$  is defined for  $x \ge 0$ 

f(x) is defined for  $6 - 2^x - 2^{3-x} \ge 0$ 

i.e. 
$$6 - 2^x - \frac{2^3}{2^x} \ge 0$$

i.e. 
$$6.2^x - (2^x)^2 - 8 \ge 0$$

i.e. 
$$(2^x)^2 - 6 \cdot 2^x + 8 \le 0$$

i.e. 
$$(2^x - 4)(2^x - 2) \le 0$$

$$2^x \ge 2$$
 and  $2^x \le 4$  (Verify!)

$$2^x \ge 2^1$$
 and  $2^x \le 2^2$ 

$$x \ge 1$$
 and  $x \le 2$  or  $1 \le x \le 2$ 

## 8) Logarithmic Function:

Let, a > 0,  $a \ne 1$ , we define

$$y = \log_a x$$
 if  $x = a^y$ .

for x > 0, is defined as

$$y = \log_a x \Leftrightarrow a^y = x$$
logarithmic form exponential form

## **Properties:**

- 1) As  $a^0 = 1$ , so  $\log_a 1 = 0$  and as  $a^1 = a$ , so  $\log_a a = 1$
- 2) As  $a^x = a^y \Leftrightarrow x = y$  so  $\log_a x = \log_a y \Leftrightarrow$ x = y
- 3) Product rule of logarithms.

For 
$$a, b, c > 0$$
 and  $a \neq 1$ ,

$$\log_a bc = \log_a b + \log_a c \quad \text{(Verify !)}$$

4) Quotient rule of logarithms.

For 
$$a, b, c > 0$$
 and  $a \neq 1$ ,

$$\log_a \frac{b}{c} = \log_a b - \log_a c \quad \text{(Verify !)}$$

5) Power/Exponent rule of logarithms.

For 
$$a$$
,  $b$ ,  $c > 0$  and  $a \ne 1$ ,

$$\log_a b^c = c \log_a b \qquad \text{(Verify !)}$$

6) For natural base e,  $\log_a x = \ln x$  as Natural Logarithm Function.

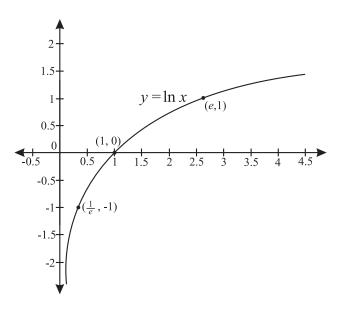

Fig. 6.30

Here domain of  $\ln x$  is  $(0, \infty)$  and range is  $(-\infty, \infty)$ .

- 8) Logarithmic inequalities:
- (i) If a>1, 0< m< n then  $\log_a m < \log_a n$ e.g.  $\log_{10} 20 < \log_{10} 30$
- (ii) If 0 < a < 1, 0 < m < n then  $\log_a m > \log_a n$ e.g.  $\log_{0.1} 20 > \log_{0.1} 30$
- (iii) For a, m>0 if a and m lies on the same side of unity (i.e. 1) then  $\log_a m > 0$ . e.g.  $\log_2 3 > 0$ ,  $\log_{0.3} 0.5 > 0$
- (iv) For a, m>0 if a and m lies on the different sides of unity (i.e. 1) then  $\log_a m < 0$ . e.g.  $\log_{0.2} 3 < 0$ ,  $\log_{3} 0.5 < 0$

**Ex. 11 :** Write log72 in terms of log2 and log3.

Solution: 
$$\log 72 = \log(2^3.3^2)$$
  
=  $\log 2^3 + \log 3^2$  (: Power rule)  
=  $3 \log 2 + 2 \log 3$ (: Power rule)

**Ex. 12**: Evaluate  $\ln e^9 - \ln e^4$ .

Solution: 
$$\ln e^9 - \ln e^4 = \log_e e^9 - \log_e e^4$$
  
=  $9 \log_e e - 4 \log_e e$   
=  $9(1) - 4(1)$  (:.  $\ln e = 1$ )  
= 5

Ex. 13: Expand 
$$\log \left\lceil \frac{x^3(x+3)}{2(x-4)^2} \right\rceil$$

**Solution:** Using Quotient rule  $= \log [x^3(x+3)] - \log [2(x-4)^2]$ 

Using Product rule

$$= [\log x^3 + \log (x+3)] - [\log 2 + \log (x-4)^2]$$

Using Power rule

$$= [3\log x + \log (x+3)] - [\log 2 - 2\log (x-4)]$$
$$= 3\log x + \log (x+3) - \log 2 + 2\log (x-4)$$

**Ex. 14** : Combine

 $3\ln (p + 1) - \frac{1}{2} \ln r + 5\ln(2q + 3)$  into single logarithm.

**Solution**: Using Power rule,

$$= \ln (p+1)^3 - \ln r^{\frac{1}{2}} + \ln(2q+3)^5$$

Using Quotient rule

$$= \ln \frac{(p+1)^3}{\sqrt{r}} + \ln(2q+3)^5$$

Using Product rule

$$= \ln \left[ \frac{(p+1)^3}{\sqrt{r}} (2q+3)^5 \right]$$

**Ex. 15**: Find the domain of ln(x-5).

**Solution :** As ln(x-5) is defined for (x-5) > 0that is x > 5 so domain is  $(5, \infty)$ .

## Let's note:

- 1)  $\log(x + y) \neq \log x + \log y$
- $2) \quad \log x \log y \neq \log (xy)$

3) 
$$\frac{\log x}{\log y} \neq \log \left(\frac{x}{y}\right)$$

- 4)  $(\log x)^n \neq n \log x$
- 9) Change of base formula:

For 
$$a$$
,  $x$ ,  $b > 0$  and  $a$ ,  $b \ne 1$ ,  $\log_a x = \frac{\log_b x}{\log_b a}$ 

Note: 
$$\log_a x = \frac{\log_x x}{\log_x a} = \frac{1}{\log_x a}$$
 (Verify!)

**Ex. 16:** Evaluate 
$$\frac{\log_4 81}{\log_4 9}$$

**Solution :** By Change of base law, as the base is same (that is 4)

$$\frac{\log_4 \ 81}{\log_4 \ 9} = \log_9 81 = 2$$

**Ex. 17:** Prove that,  $2\log_b a^4 \cdot \log_c b^3 \cdot \log_a c^5 = 120$ 

Solution: L.H.S. = 
$$2\log_b a^4 \cdot \log_c b^3 \cdot \log_a c^5$$
  
=  $4 \times 2\log_b a \times 3\log_c b \times 5\log_a c$ 

Using change of base law,

$$= 4 \times 2 \frac{\log a}{\log b} \times 3 \frac{\log b}{\log c} \times 5 \frac{\log c}{\log a}$$
$$= 120$$

**Ex. 18:** Find the domain of  $f(x) = \log_{x+5} (x^2 - 4)$ 

**Solution :** Since  $\log_a x$  is defined for a, x > 0 and  $a \ne 1$  f(x) is defined for  $(x^2 - 4) > 0$ , x + 5 > 0,  $x + 5 \ne 1$ .

i.e. 
$$(x-2)(x+2) > 0$$
,  $x > -5$ ,  $x \neq -4$ 

i.e. 
$$x < -2$$
 or  $x > 2$  and  $x > -5$  and  $x \neq -4$ 

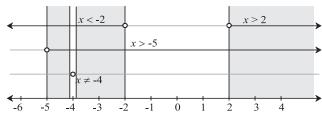

Fig. 6.31

## 9) Trigonometric function

The graphs of trigonometric functions are discuse in chapter 2 of Mathematics Book I.

f(x)	Domain	Range
sin x	R	[-1,1]
cos x	R	[-1,1]
tan x	$R - \left\{\pm \frac{\pi}{2}, \pm \frac{3\pi}{2} \dots \right\}$	R

## **EXERCISE 6.1**

- 1) Check if the following relations are functions.
- (a)

(b)

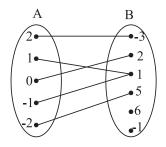

Fig. 6.32

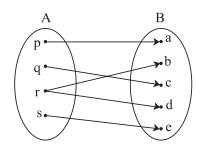

Fig. 6.33

(c)

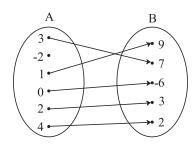

Fig. 6.34

- Which sets of ordered pairs represent 2) functions from  $A = \{1, 2, 3, 4\}$  to  $B = \{-1, 0, 1\}$ 1, 2, 3}? Justify.
  - (a)  $\{(1,0), (3,3), (2,-1), (4,1), (2,2)\}$
  - (b)  $\{(1,2), (2,-1), (3,1), (4,3)\}$
  - (c)  $\{(1,3), (4,1), (2,2)\}$
  - (d)  $\{(1,1), (2,1), (3,1), (4,1)\}$
- Check if the relation given by the equation represents y as function of x.
  - (a) 2x + 3y = 12
- (b)  $x + y^2 = 9$
- (c)  $x^2 y = 25$
- (d) 2v + 10 = 0
- (e) 3x 6 = 21
- If  $f(m) = m^2 3m + 1$ , find 4)
  - (a) f(0)
- (b) f(-3)
- $(c) f\left(\frac{1}{2}\right)$
- (d) f(x+1)
- (e) f(-x)
- (f)  $\left(\frac{f(2+h)-f(2)}{h}\right)$ ,  $h \neq 0$ .
- 5) Find x, if g(x) = 0 where
  - (a)  $g(x) = \frac{5x-6}{7}$  (b)  $g(x) = \frac{18-2x^2}{7}$
  - (c)  $g(x) = 6x^2 + x 2$
  - (d)  $g(x) = x^3 2x^2 5x + 6$
- Find x, if f(x) = g(x) where 6)
  - (a)  $f(x) = x^4 + 2x^2$ ,  $g(x) = 11x^2$
  - (b)  $f(x) = \sqrt{x} -3$ , g(x) = 5 x

- 7) If  $f(x) = \frac{a-x}{b-x}$ , f(2) is undefined, and f(3) = 5, find a and b.
- Find the domain and range of the following functions.

(a) 
$$f(x) = 7x^2 + 4x - 1$$

(b) g (x) = 
$$\frac{x+4}{x-2}$$

(c) 
$$h(x) = \frac{\sqrt{x+5}}{5+x}$$

(d) 
$$f(x) = \sqrt[3]{x+1}$$

(e) 
$$f(x) = \sqrt{(x-2)(5-x)}$$

(f) 
$$f(x) = \sqrt{\frac{x-3}{7-x}}$$

(g) 
$$f(x) = \sqrt{16 - x^2}$$

- Express the area A of a square as a function of its (a) side s (b) perimeter P.
- 10) Express the area A of circle as a function of its (a) radius r (b) diameter d (c) circumference C.
- 11) An open box is made from a square of cardboard of 30 cms side, by cutting squares of length x centimeters from each corner and folding the sides up. Express the volume of the box as a function of x. Also find its domain.

Let f be a subset of  $Z \times Z$  defined by

- 12)  $f = \{(ab,a+b) : a,b \in \mathbb{Z}\}$ . Is f a function from Z to Z? Justify.
- 14) Check the injectivity and surjectivity of the following functions.
  - (a)  $f: \mathbb{N} \to \mathbb{N}$  given by  $f(x) = x^2$
  - (b)  $f: \mathbb{Z} \to \mathbb{Z}$  given by  $f(x) = x^2$
  - (c)  $f: \mathbb{R} \to \mathbb{R}$  given by  $f(x) = x^2$

- (d)  $f: \mathbb{N} \to \mathbb{N}$  given by  $f(x) = x^3$
- (e)  $f: \mathbb{R} \to \mathbb{R}$  given by  $f(x) = x^3$
- 14) Show that if  $f: A \to B$  and  $g: B \to C$  are one-one, then  $g \circ f$  is also one-one.
- 15) Show that if  $f: A \to B$  and  $g: B \to C$  are onto, then  $g \circ f$  is also onto.
- 16) If  $f(x) = 3(4^{x+1})$  find f(-3).
- 17) Express the following exponential equations in logarithmic form
  - $(a)2^5 = 32$
- (b)  $54^0 = 1$
- (c)  $23^1 = 23$
- (d)  $9^{3/2} = 27$
- (e)  $3^{-4} = \frac{1}{81}$
- (f)  $10^{-2} = 0.01$
- (g)  $e^2 = 7.3890$
- (h)  $e^{1/2} = 1.6487$
- (i)  $e^{-x} = 6$
- 18) Express the following logarithmic equations in exponential form
  - (a)  $\log_2 64 = 6$
- (b)  $\log_5 \frac{1}{25} = -2$
- (c)  $\log_{10} 0.001 = -3$  (d)  $\log_{1/2} (-8) = 3$
- (e)  $\ln 1 = 0$
- (f)  $\ln e = 1$
- (g)  $\ln \frac{1}{2} = -0.693$
- 19) Find the domain of
  - (a)  $f(x) = \ln(x 5)$
  - (b)  $f(x) = \log_{10}(x^2 5x + 6)$
- 20) Write the following expressions as sum or difference of logarithms

  - (a)  $\log \left( \frac{pq}{rs} \right)$  (b)  $\log \left( \sqrt{x} \sqrt[3]{y} \right)$
  - (c)  $\ln \left( \frac{a^3 (a-2)^2}{\sqrt{h^2+5}} \right)$
  - (d)  $\ln \left[ \frac{\sqrt[3]{x-2}(2x+1)^4}{(x+4)\sqrt{2x+4}} \right]^2$

- 21) Write the following expressions as a single logarithm.
  - (a)  $5\log x + 7\log y \log z$
  - (b)  $\frac{1}{2} \log (x-1) + \frac{1}{2} \log (x)$
  - (c)  $\ln (x+2) + \ln (x-2) 3\ln (x+5)$
- 22) Given that  $\log 2 = a$  and  $\log 3 = b$ , write  $\log \sqrt{96}$  in terms of a and b.
- 23) Prove that

  - (a)  $b^{\log_b a} = a$  (b)  $\log_{b^m} a = \frac{1}{m} \log_b a$
  - (c)  $a^{\log_c b} = b^{\log_c a}$
- 24) If  $f(x) = ax^2 bx + 6$  and f(2) = 3 and f(4) = 30, find a and b
- 25) Solve for x.
  - (a)  $\log 2 + \log(x+3) \log(3x-5) = \log 3$
  - (b)  $2\log_{10} x = 1 + \log_{10} \left( x + \frac{11}{10} \right)$
  - (c)  $\log_2 x + \log_4 x + \log_{16} x = \frac{21}{4}$
  - (d)  $x + \log_{10}(1+2^x) = x \log_{10} 5 + \log_{10} 6$
- 26) If  $\log \left( \frac{x+y}{3} \right) = \frac{1}{2} \log x + \frac{1}{2} \log y$ , show that  $\frac{x}{y} + \frac{y}{x} = 7$ .
- 27) If  $\log\left(\frac{x-y}{4}\right) = \log\sqrt{x} + \log\sqrt{y}$ , show that  $(x+y)^2 = 20 xy$
- 28) If  $x = \log_a bc$ ,  $y = \log_b ca$ ,  $z = \log_a ab$ then prove that  $\frac{1}{1+x} + \frac{1}{1+y} + \frac{1}{1+z} = 1$

## **6.2 Algebra of functions:**

Let f and g be functions with domains A and B. Then the functions  $f+g, f-g, fg, \frac{f}{g}$  are defined on  $A\cap B$  as follows.

## **Operations**

$$(f+g)(x) = f(x) + g(x)$$

$$(f-g)(x) = f(x) - g(x)$$

$$(f. g)(x) = f(x).g(x)$$

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$$
 where  $g(x) \neq 0$ 

**Ex. 1:** If  $f(x) = x^2 + 2$  and g(x) = 5x - 8, then find

- i) (f+g)(1)
- ii) (f-g)(-2)
- ii)  $(f \circ g) (3m)$
- iv)  $\frac{f}{g}(0)$

Solution: i) As 
$$(f+g)(x) = f(x) + g(x)$$
  
 $(f+g)(1) = f(1) + g(1)$   
 $= [(1)^2 + 2] + [5(1) - 8]$   
 $= 3 + (-3)$   
 $= 0$ 

ii) As 
$$(f - g)(x) = f(x) - g(x)$$
  
 $(f - g)(-2) = f(-2) - g(-2)$   
 $= [(-2)^2 + 2] - [5(-2) - 8]$   
 $= [4 + 2] - [-10 - 8]$   
 $= 6 + 18$   
 $= 24$ 

iii) As 
$$(fg)(x) = f(x)g(x)$$

$$(f \circ g) (3m) = f (3m)g (3m)$$
  
=  $[(3m)^2 + 2] [5(3m) - 8]$   
=  $[9m^2 + 2] [15m - 8]$   
=  $135m^3 - 72m^2 + 30m - 16$ 

iv) As 
$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$$
  
 $\left(\frac{f}{g}\right)(0) = \frac{f(0)}{g(0)} = \frac{0^2 + 2}{5(0) - 8}$   
 $= \frac{2}{-8} = -\frac{1}{4}$ 

**Ex. 2**: Given the function  $f(x) = 5x^2$  and

 $g(x) = \sqrt{4-x}$  find the domain of

i) 
$$(f+g)(x)$$
 ii)  $(f \circ g)(x)$  iii)  $\frac{f}{g}(x)$ 

**Solution :** i) Domain of  $f(x) = 5x^2$  is  $(-\infty, \infty)$ .

To find domain of  $g(x) = \sqrt{4-x}$ 

$$4 - x > 0$$

$$x - 4 < 0$$

Let  $x \le 4$ , So domain is  $(-\infty, 4]$ .

Therefore, domain of (f + g)(x) is

$$(-\infty, \infty) \cap (-\infty, 4]$$
, that is  $(-\infty, 4]$ 

- ii) Similarly, domain of  $(f \circ g)$   $(x) = 5x^2 \sqrt{4-x}$ is  $(-\infty, 4]$
- iii) And domain of  $\left(\frac{f}{\sigma}\right)(x) = \frac{5x^2}{\sqrt{4-x}}$  is  $(-\infty, 4)$

As , at x = 4 the denominator g(x) = 0.

#### **6.2.1 Composition of Functions:**

A method of combining the function  $f: A \rightarrow B$  with  $g: B \rightarrow C$  is composition of functions, defined as  $(f \circ g)(x) = f[g(x)]$  an read as 'f composed with g'

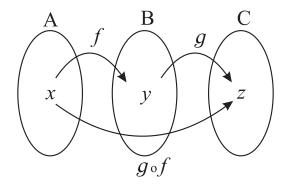

Fig. 6.35

#### Note:

- The domain of  $g \circ f$  is the set of all x in A such that f(x) is in the B. The range of  $g \circ f$  is set of all g [f(x)] in C such that f(x) is in B.
- Domain of  $g \circ f \subseteq Domain of f$  and Range of  $g \circ f \subseteq \text{Range of } g$ .

## **Illustration:**

A cow produces 4 liters of milk in a day. Then x number of cows produce 4x liters of milk in a day. This is given by function f(x) = 4x = 'y'. Price of one liter milk is Rs. 50. Then the price of y liters of the milk is Rs. 50y. This is given by another function g(y) = 50y. Now a function h(x)gives the money earned from x number of cows in a day as a composite function of f and g as h(x) = $(g \circ f)(x) = g[f(x)] = g(4x) = 50(4x) = 200x.$ 

**Ex. 3:** If  $f(x) = \frac{2}{x+5}$  and  $g(x) = x^2 - 1$ , then find i)  $(f \circ g) (x)$  ii)  $(g \circ f) (3)$ 

#### **Solution:**

As  $(f \circ g)(x) = f[g(x)]$  and  $f(x) = \frac{2}{x+5}$ Replace x from f(x) by g(x), to get  $(f \circ g)(x) = \frac{2}{g(x) + 5}$ 

$$= \frac{2}{x^2 - 1 + 5}$$
$$= \frac{2}{x^2 + 4}$$

As  $(g \circ f)(x) = g[f(x)]$  and  $g(x) = x^2 - 1$ Replace x by f(x), to get

$$(g \circ f)(x) = [f(x)]^2 - 1$$
  
=  $\left(\frac{2}{x+5}\right)^2 - 1$ 

Now let x = 3

$$(g \circ f) (3) = \left(\frac{2}{3+5}\right)^2 - 1$$
$$= \left(\frac{2}{8}\right)^2 - 1$$
$$= \left(\frac{1}{4}\right)^2 - 1$$
$$= \frac{1-16}{16}$$
$$= -\frac{15}{16}$$

**Ex 4:** If  $f(x) = x^2$ , g(x) = x + 5, and  $h(x) = \frac{1}{x}$ ,  $x \neq 0$ , find  $(g \circ f \circ h)(x)$ 

**Solution**:  $(g \circ f \circ h)(x)$  $= g \{ f [h (x)] \}$  $= g \left| f\left(\frac{1}{x}\right) \right|$  $= g \left| \left( \frac{1}{x} \right)^2 \right|$  $=\left(\frac{1}{x}\right)^2+5$  $=\frac{1}{r^2}+5$ 

Ex. 5: If  $h(x) = (x - 5)^2$ , find the functions f and g, such that  $h = f \circ g$ .

 $\rightarrow$  In h (x), 5 is subtracted from x first and then squared. Let g(x) = x - 5 and  $f(x) = x^2$ , (verify)

**Ex. 6:** Express  $m(x) = \frac{1}{x^3 + 7}$  in the form of  $f \circ g \circ h$ 

 $\rightarrow$  In m (x), x is cubed first then 7 is added and then its reciprocal taken. So,

$$h(x) = x^3$$
,  $g(x) = x + 7$  and  $f(x) = \frac{1}{x}$ , (verify)

#### **6.2.2 Inverse functions:**

Let  $f : A \to B$  be one-one and onto function and f(x) = y for  $x \in A$ . The inverse function

 $f^{-1}$ : B  $\rightarrow$  A is defined as  $f^{-1}(y) = x$  if f(x) = y

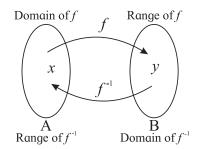

Fig. 6.36

#### Note:

- 1) As f is one-one and onto every element  $y \in B$  has a unique element  $x \in A$  such that y = f(x).
- 2) If f and g are one-one and onto functions such that f[g(x)] = x for every  $x \in Domain$  of g and g[f(x)] = x for every  $x \in Domain$  of f, then g is called inverse of function f. Function g is denoted by  $f^{-1}$  (read as f inverse). i.e. f[g(x)] = g[f(x)] = x then  $g = f^{-1}$  which Moreover this means  $f[f^{-1}(x)] = f^{-1}[f(x)] = x$
- 3)  $f^{-1}(x) \neq [f(x)]^{-1}$ , because  $[f(x)]^{-1} = \frac{1}{f(x)}$  $[f(x)]^{-1}$  is reciprocal of function f(x) where as  $f^{-1}(x)$  is the inverse function of f(x).

e.g. If f is one-one onto function with f(3) = 7 then  $f^{-1}(7) = 3$ .

Ex. 7: If f is one-one onto function with f(x) = 9 - 5x, find  $f^{-1}(-1)$ .

**Soln.**:  $\to$  Let  $f^{-1}(-1) = m$ , then -1 = f(m)

Therefore,

$$-1 = 9 - 5m$$
$$5m = 9 + 1$$
$$5m = 10$$
$$m = 2$$

That is f(2) = -1, so  $f^{-1}(-1) = 2$ .

**Ex. 8 :** Verify that  $f(x) = \frac{x-5}{8}$  and g(x) = 8x + 5 are inverse functions of each other.

**Solution**: As  $f(x) = \frac{x-5}{8}$ , replace x in f(x) with g(x)

 $f[g(x)] = \frac{g(x)-5}{8} = \frac{8x+5-5}{8} = \frac{8x}{8} = x$ and g(x) = 8x + 5, replace x in g(x) with f(x)

$$g[f(x)] = 8f(x) + 5 = 8\left[\frac{x-5}{8}\right] + 5 = x - 5 + 5$$
= x

As f[g(x)] = x and g[f(x)] = x, f and g are inverse functions of each other.

Ex. 9: Determine whether the function

$$f(x) = \frac{2x+1}{x-3}$$
 has inverse, if it exists find it.

**Solution**:  $f^{-1}$  exists only if f is one-one and onto.

Consider 
$$f(x_1) = f(x_2)$$
,

Therefore,

$$\frac{2x_1+1}{x_1-3} = \frac{2x_2+1}{x_2-3}$$

$$(2x_1+1)(x_2-3) = (2x_2+1)(x_1-3)$$

$$2x_1x_2 - 6x_1 + x_2 - 3 = 2x_1x_2 - 6x_2 + x_1 - 3$$

$$-6x_1 + x_2 = -6x_2 + x_1$$

$$6x_1 + x_2 = 6x_2 + x_1$$

$$7x_2 = 7x_1$$

$$x_2 = x_1$$

Hence, *f* is one-one function.

Let 
$$f(x) = y$$
, so  $y = \frac{2x+1}{x-3}$ 

Express x as function of y, as follows

$$y = \frac{2x+1}{x-3}$$

$$y(x-3) = 2x + 1$$

$$xy-3y=2x+1$$

$$xy - 2x = 3y + 1$$

$$x(y-2) = 3y + 1$$

$$\therefore \qquad x = \frac{3y+1}{y-2} \text{ for } y \neq 2.$$

Thus for any  $y \neq 2$ ,

we have x such that f(x) = y

 $f^{-1}$  is well defined on R -  $\{2\}$ 

If 
$$f(x) = 2$$
 i.e.  $2x + 1 = 2(x - 3)$ 

i.e. 
$$2x + 1 = 2x - 6$$
 i.e.  $1 = -6$ 

Which is contradiction.

 $2 \notin \text{Range of } f$ .

Here the range of f(x) is  $R - \{2\}$ .

x is defined for all y in the range.

Therefore f(x) is onto function.

As f is one-one and onto, so  $f^{-1}$  exists.

As 
$$f(x) = y$$
, so  $f^{-1}(y) = x$ 

Therefore, 
$$f^{-1}(y) = \frac{3y+1}{y-2}$$

Replace x by y, to get

$$f^{-1}(x) = \frac{3x+1}{x-2}$$
.

#### **6.2.3 Piecewise Defined Functions:**

A function defined by two or more equations on different parts of the given domain is called piecewise defind function.

e.g.: If 
$$f(x) = \begin{cases} x+1 & \text{if } x < 1 \\ 4-x & \text{if } x \ge 1 \end{cases}$$

Here 
$$f(3) = 4 - 3 = 1$$
 as  $3 > 1$ ,

whereas 
$$f(-2) = -2 + 1 = -1$$
 as  $-2 < 1$  and

$$f(1) = 4 - 1 = 3$$
.

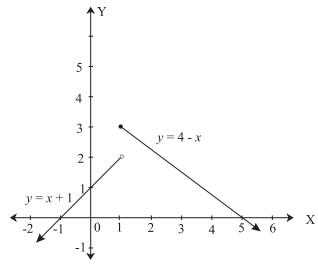

Fig. 6.37

As (1,3) lies on line y = 4 - x, so it is shown by small black disc on that line. (1,2) is shown by small white disc on the line y = x + 1, because it is not on the line.

## 1) Signum function:

**Definition:**  $f(x) = \operatorname{sgn}(x)$  is a piecewise function

$$f(x) = \begin{cases} -1 & \text{if } x < 0 \\ 0 & \text{if } x = 0 \\ 1 & \text{if } x > 0 \end{cases}$$

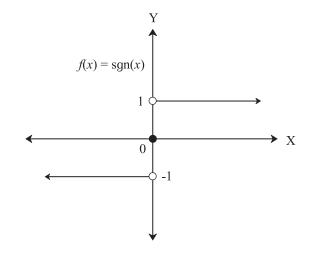

Fig. 6.38

**Domain:** R and **Range:**  $\{-1, 0, 1\}$ 

## **Properties:**

- For x > 0, the graph is line y = 1 and for x < 01) 0, the graph is line y = -1.
- For f(0) = 0, so point (0,0) is shown by 2) black disc, whereas points (0,-1) and (0,1)are shown by white discs.

#### **Absolute value function (Modulus function):**

Definition: f(x) = |x|, is a piece wise function

$$f(x) = \begin{cases} x & \text{if } x \ge 0 \\ -x & \text{if } x < 0 \end{cases}$$

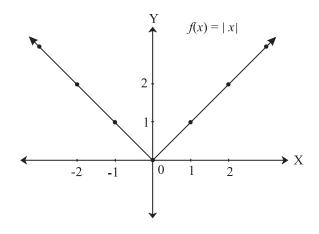

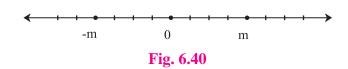

Fig. 6.39

**Domain**: R or  $(-\infty,\infty)$  and **Range**:  $[0,\infty)$ 

## **Properties:**

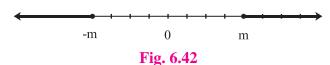

- 1) Graph of f(x) = |x| is union of line y = x from quadrant I with the line y = -x from quadrant II. As origin marks the change of directions of the two lines, we call it a critical point.
- 2) Graph is symmetric about y-axis.
- 3) Graph of f(x) = |x-3| is the graph of |x| shifted 3 units right and the critical point is (3,0).
- 4) f(x) = |x|, represents the distance of x from origin.
- 5) If |x| = m, then it represents every x whose distance from origin is m, that is x = +m or x = -m.

If |x| < m, then it represents every x whose distance from origin is less than m,  $0 \le x < m$ and 0 > x > -m That is -m < x < m. In interval notation  $x \in (-m, m)$ 

If  $|x| \ge m$ , then it represents every x whose distance from origin is greater than or equal to m, so,  $x \ge m$  and  $x \le -m$ . In interval notation  $x \in (-\infty, m] \cup [m, \infty)$ 

If m < |x| < n, then it represents all x whose distance from origin is greater than *m* but less than n. That is  $x \in (-n, -m) \cup (m, n)$ .

- Triangle inequality  $|x + y| \le |x| + |y|$ . Verify by taking different values for x and y (positive or negative).
- 10) |x| can also be defined as  $|x| = \sqrt{x^2}$  $= \max\{x, -x\}.$

**Ex. 10**: Solve  $|4x - 5| \le 3$ .

**Solution :** If  $|x| \le m$ , then  $-m \le x \le m$ 

Therefore

$$-3 \le 4x - 5 \le 3$$

$$-3 + 5 \le 4x \le 3 + 5$$

$$2 \le 4x \le 8$$

$$\frac{2}{4} \le x \le \frac{8}{4}$$

$$\frac{1}{2} \le x \le 2$$

**Ex. 11:** Find the domain of  $\frac{1}{\sqrt{||x|-1|-3}}$ 

**Solution :** As function is defined for ||x|-1|-3>0

Therefore ||x|-1|>3

So |x|-1>3 or |x|-1<-3

That is

|x| > 3 + 1 or |x| < -3 + 1

|x| > 4 or |x| < -2

But |x| < -2 is not possible as |x| > 0 always

So 
$$-4 < x < 4$$
,  $x \in (-4, 4)$ .

**Ex. 12 :** Solve |x-1| + |x+2| = 8.

**Solution :** Let f(x) = |x - 1| + |x + 2|

Here the critical points are at x = 1 and x = -2.

They divide number line into 3 parts, as follows.

$$x - 1 - ve$$
 $x - 1 - 3$ 
 $x + 2$ 
 $x + 3$ 
 $x + 2$ 
 $x + 3$ 
 $x +$ 

Fig. 6.44

Region	Test Value	Sign	f(x)
$I \\ x < -2$	-3	(x-1) < 0, (x+2) < 0	-(x-1) - (x+2) = -2 x -1
II $-2 \le x \le 1$	0	` ′	-(x-1)+(x+2)
III	2	` ′	(x-1) + (x+2)
<i>x</i> >1		(x + 2) > 0	= 2 x + 1

As 
$$f(x) = 8$$

From I, 
$$-2x - 1 = 8$$
 :  $-2x = 9$  :  $x = -\frac{9}{2}$ .

From II, 3 = 8, which is impossible, hence there is no solution in this region.

From III, 
$$2x + 1 = 8$$
 :  $2x = 7$  :  $x = \frac{7}{2}$ .

Solutions are 
$$x = -\frac{9}{2}$$
 and  $x = \frac{7}{2}$ .

## 3) Greatest Integer Function (Step Function):

**Definition:** For every real x, f(x) = [x] =The greatest integer less than or equal to x. [x] is also called as floor function and represented by |x|.

#### **Illustrations:**

1) f(5.7)=[5.7] = greatest integer less than or equal to 5.7

Integers less than or equal to 5.7 are 5, 4, 3, 2 of which 5 is the greatest.

2) f(-6.3) = [-6.3] = greatest integer less than or equal to -6.3.

Integers less than or equal to -6.3 are -10, -9, -8, -7 of which -7 is the greatest.

$$\therefore [-6.3] = -7$$

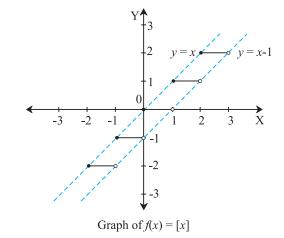

3) f(2) = [2] = greatest integer less than or equal to 2 = 2.

4) 
$$[\pi] = 3$$
 5)  $[e] = 2$ 

The function can be defined piece-wise as follows

$$f(x) = n$$
, if  $n \le x < n + 1$  or  $x \in [n, n + 1)$ ,  $n \in I$ 

$$f(x) = \begin{cases} -2 & \text{if } -2 \le x < -1 \text{ or } x \in [-2, -1) \\ -1 & \text{if } -1 \le x < 0 \text{ or } x \in [-1, 0) \\ 0 & \text{if } 0 \le x < 1 \text{ or } x \in [0, 1) \\ 1 & \text{if } 1 \le x < 2 \text{ or } x \in [1, 2) \\ 2 & \text{if } 2 \le x < 3 \text{ or } x \in [2, 3) \end{cases}$$

**Fig. 6.45** 

Domain = R and Range = I (Set of integers)

## **Properties:**

- 1) If  $x \in [2,3)$ , f(x) = 2 shown by horizontal line. At exactly x = 2, f(2) = 2,  $2 \in [2,3)$  hence shown by black disc, whereas  $3 \notin [2,3)$  hence shown by white disc.
- 2) Graph of y = [x] lies in the region bounded by lines y = x and y = x - 1. So  $x - 1 \le [x] < x$

3) 
$$[x] + [-x] = \begin{cases} 0 & \text{if } x \in I \\ -1 & \text{if } x \notin I \end{cases}$$

Ex. 
$$[3.4] + [-3.4] = 3 + (-4) = -1$$
 where  $3.4 \notin I$   
 $[5] + [-5] = 5 + (-5) = 0$  where  $5 \in I$ 

4) 
$$[x+n] = [x] + n$$
, where  $n \in I$ 

Ex. 
$$[4.5 + 7] = [11.5] = 11$$
 and

$$[4.5] + 7 = 4 + 7 = 11$$

## 4) Fractional part function:

**Definition:** For every real x,  $f(x) = \{x\}$  is defined as  $\{x\} = x - [x]$ 

#### **Illustrations:**

$$f(4.8) = \{4.8\} = 4.8 - [4.8] = 4.8 - 4 = 0.8$$

$$f(-7.1) = \{-7.1\} = -7.1 - [-7.1]$$
$$= -7.1 - (-8) = -7.1 + 8 = 0.9$$

$$f(8) = \{8\} = 8 - [8] = 8 - 8 = 0$$

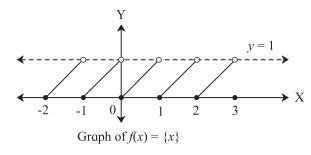

Fig. 6.46

Domain = R and Range = [0,1)

## **Properties:**

- 1) If  $x \in [0,1]$ ,  $f(x) = \{x\} \in [0,1)$  shown by slant line y = x. At x = 0, f(0) = 0,  $0 \in [0,1)$  hence shown by black disc, whereas at x = 1, f(1) = 1,  $1 \notin [0,1)$  hence shown by white disc.
- 2) Graph of  $y = \{x\}$  lies in the region bounded by y = 0 and y = 1. So  $0 \le \{x\} < 1$

3) 
$$\{x\} + \{-x\} = \begin{cases} 0 & \text{if } x \in I \\ 1 & \text{if } x \notin I \end{cases}$$

Ex. 13: 
$$\{5.2\}+\{-5.2\} = 0.2+0.8 = 1$$
 where  $5.2 \in 1$   
 $\{7\}+\{-7\} = 0+(0) = 0$  where  $7 \in I$ 

4) 
$$\{x \pm n\} = \{x\}, \text{ where } n \in I$$

Ex. 14: 
$$\{2.8+5\} = \{7.8\} = 0.8$$
 and  $\{2.8\} = 0.8$   
 $\{2.8-5\} = \{-2.2\} = -2.2 - (-2.2) = -2.2 - (-3)$   
 $= 0.8 \ (\because \{x\} = x - [x])$ 

**Ex. 15**: If  $\{x\}$  and [x] are the fractional part function and greatest integer function of x respectively. Solve for x, if  $\{x + 1\} + 2x = 4[x + 1] - 6$ .

**Solution :** 
$$\{x+1\} + 2x = 4[x+1] - 6$$

Since  $\{x + n\} = \{x\}$  and [x + n] = [x] + n, for  $n \in I$ , also  $x = [x] + \{x\}$ 

$$\therefore$$
 {x} + 2({x} + [x]) = 4([x] + 1) - 6

$$\therefore$$
 {x} + 2{x} + 2[x] = 4[x] + 4 - 6

$$\therefore$$
 3{x} = 4[x] - 2[x] - 2

$$\therefore$$
 3{x} = 2[x] - 2 ... (I)

Since  $0 \le \{x\} < 1$ 

$$0 \le 3\{x\} < 3$$

$$\therefore$$
  $0 \le 2 [x] - 2 < 3$  (: from I)

$$0 + 2 \le 2[x] < 3 + 2$$

$$\therefore$$
 2 \le 2 \le x \right] < 5

$$\therefore \quad \frac{2}{2} \le [x] < \frac{5}{2}$$

$$1 \le [x] < 2.5$$

But as [x] takes only integer values

$$[x] = 1$$
, 2 since  $[x] = 1 \Rightarrow 1 \le x < 2$  and  $[x] = 2 \Rightarrow 2 \le x < 3$ 

Therefore  $x \in [1,3)$ 

#### Note:

1)

Property	f(x)
f(x+y) = f(x) + f(y)	kx
f(x+y) = f(x)f(y)	$a^{kx}$
f(xy) = f(x) f(y)	$\chi^n$
f(xy) = f(x) + f(y)	$\log x$

- 2) If n(A) = m and n(B) = n then
  - (a) number of functions from A and B is  $n^m$  (b) for  $m \le n$ , number of one-one functions is  $\frac{n!}{(n-m)!}$
  - (c) for m > n, number of one-one functions is
  - (d) for  $m \ge n$ , number of onto functions are  $n^{m} - {}^{n}C_{1}(n-1)^{m} + {}^{n}C_{2}(n-2)^{m} - {}^{n}C_{3}(n-3)^{m}$  $+ ... + (-1)^{n-1} {}^{n}C_{n-1}$
  - (e) for m < n, number of onto functions are 0.
  - (f) number of constant fuctions is m.
- 3) Characteristic & Mantissa of Common Logarithm  $\log_{10} x$ :

$$\operatorname{As} x = [x] + \{x\}$$

$$\log_{10} x = [\log_{10} x] + \{\log_{10} x\}$$

Where, integral part  $[\log_{10} x]$  is called Characteristic & fractional part  $\{\log_{10} x\}$  is called Mantissa.

**Illustration**: For  $\log_{10} 23$ ,

$$\log_{10} 10 < \log_{10} 23 < \log_{10} 100$$

$$\log_{10} 10 < \log_{10} 23 < \log_{10} 10^2$$

$$\log_{10} 10 < \log_{10} 23 < 2\log_{10} 10$$
  
$$1 < \log_{10} 23 < 2 \quad (\because \log_{10}^{10} = 1)$$

Then  $[\log_{10} 23] = 1$ , hence Characteristic of  $\log_{10} 23$  is 1.

The characteristic of the logarithm of a number N, with 'm' digits in its integral part is 'm-1'.

**Ex. 16**: Given that  $\log_{10} 2 = 0.3010$ , find the number of digits in the number  $20^{10}$ .

**Solution**: Let  $x = 20^{10}$ , taking  $\log_{10}$  on either sides, we get

$$\log_{10} x = \log_{10} (20^{10}) = 10\log_{10} 20$$

$$= 10\log_{10} (2 \times 10) = 10\{\log_{10} 2 + \log_{10} 10\}$$

$$= 10\{\log_{10} 2 + 1\} = 10\{0.3010 + 1\}$$

$$= 10(1.3010) = 13.010$$

That is characteristic of x is 13.

So number of digits in x is 13 + 1 = 14

## **EXERCISE 6.2**

- 1) If f(x) = 3x + 5, g(x) = 6x 1, then find (a) (f+g)(x)(b) (f-g) (2) (c) (fg) (3) (d) (f/g) (x) and its domain.
- 2) Let  $f: \{2,4,5\} \rightarrow \{2,3,6\}$  and  $g: \{2,3,6\} \rightarrow \{2,4\}$ be given by  $f = \{(2,3), (4,6), (5,2)\}$  and  $g = \{(2,4), (3,4), (6,2)\}$ . Write down  $g \circ f$
- If  $f(x) = 2x^2 + 3$ , g(x) = 5x 2, then find (a)  $f \circ g$ (b)  $g \circ f$ (c)  $f \circ f$ (d)  $g \circ g$
- Verify that f and g are inverse functions of each other, where

(a) 
$$f(x) = \frac{x-7}{4}$$
,  $g(x) = 4x + 7$ 

(b) 
$$f(x) = x^3 + 4$$
,  $g(x) = \sqrt[3]{x - 4}$ 

(c) 
$$f(x) = \frac{x+3}{x-2}$$
,  $g(x) = \frac{2x+3}{x-1}$ 

- 5) Check if the following functions have an inverse function. If yes, find the inverse function.
  - (a)  $f(x) = 5x^2$
- (b) f(x) = 8
- (c)  $f(x) = \frac{6x-7}{3}$  (d)  $f(x) = \sqrt{4x+5}$
- (e)  $f(x) = 9x^3 + 8$
- $(f) f(x) = \begin{cases} x+7 & x < 0 \\ 8-x & x \ge 0 \end{cases}$
- 6) If  $f(x) = \begin{cases} x^2 + 3, & x \le 2 \\ 5x + 7, & x > 2 \end{cases}$ , then find (a) f(3) (b) f(2)
- If  $f(x) = \begin{cases} 4x 2, & x \le -3 \\ 5, & -3 < x < 3, \text{ then find } \\ x^2, & x \ge 3 \end{cases}$ (c) f(1)(d) f(5)
- If f(x) = 2|x| + 3x, then find 8) (a) f(2) (b) f(-5)
- 9) If f(x) = 4[x] - 3, where [x] is greatest integer function of x, then find
  - (a) f(7.2)
- (b) f(0.5)
- (c)  $f\left(-\frac{5}{2}\right)$  (d)  $f(2\pi)$ , where  $\pi = 3.14$
- 10) If  $f(x) = 2\{x\} + 5x$ , where  $\{x\}$  is fractional part function of x, then find
  - (a) f(-1)
- (b)  $f\left(\frac{1}{4}\right)$
- (c) f(-1.2)

- 11) Solve the following for x, where |x| is modulus function, [x] is greatest integer function, [x]is a fractional part function.
  - (a)  $|x+4| \ge 5$
- (b) |x-4| + |x-2| = 3
- (b)  $x^2 + 7|x| + 12 = 0$  (d)  $|x| \le 3$
- (e) 2|x| = 5
- (f) [x + [x + [x]]] = 9 (g)  $\{x\} > 4$
- (h)  $\{x\} = 0$
- (i)  $\{x\} = 0.5$
- (i)  $2\{x\} = x + [x]$

If  $f: A \to B$  is a function and f(x) = y, where  $x \in A$  and  $y \in B$ , then

**Domain** of f is A = Set of Inputs = Set of Pre-images = Set of values of x for which y = f(x) is defined = Projection of graph of f(x) on X-axis.

**Range** of f is f (A) = Set of Outputs = Set of Images = Set of values of y for which y =f(x) is defined = Projection of graph of f(x) on Y-axis.

**Co-domain** of f is B.

- If  $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$  then f is **one-one** and for every  $y \in B$ , if there exists  $x \in A$ such that f(x) = y then f is **onto**.
- If  $f:A \rightarrow B$ .  $g:B \rightarrow C$  then a function  $g \circ f: A \to C$  is a **composite function**.
- If  $f:A \to B$ , then  $f^{-1}:B \to A$  is **inverse function** of f.
- If  $f: \mathbb{R} \to \mathbb{R}$  is a real valued function of real variable, the following table is formed.

Type of f	Form of $f$	Domain of $f$	Range of f
Constant function	f(x) = k	R	k
Identity function	f(x) = x	R	R
Square function	$f(x) = x^2$	R	$[0,\infty)$ or $R^+$
Cube function	$f(x) = x^3$	R	R
Linear function	f(x) = ax + b	R	R
Quadratic function	$f(x) = ax^2 + bx + c$	R	$\left(\frac{4ac-b^2}{4a},\infty\right)$
Cubic function	$f(x) = ax^3 + bx^2 + cx + d$	R	R
Square root funtion	$f(x) = \sqrt{x}$	$[0,\infty)$	[0, ∞) or R <sup>+</sup>
Cube root function	$f(x) = \sqrt[3]{x}$	R	R
Rational function	$f(x) = \frac{p(x)}{q(x)}$	$R - \{x \mid q(x) = 0\}$	depends on $p(x)$ and $q(x)$
Exponential function	$f(x) = a^x,  a > 1$	R	$(0,\infty)$
Logarithmic function	$f(x) = \log_a x,  a > 1$	(0, ∞) or R <sup>+</sup>	R
Absolute function	f(x) =  x	R	[0, ∞) or R <sup>+</sup>
Signum function	$f(x) = \operatorname{sgn}(x)$	R	{-1, 0, 1}
Greatest Integer function	f(x) = [x]	R	I (set of integers)
Fractional Part function	$f(x) = \{x\}$	R	[0,1)

## **MISCELLANEOUS EXERCISE 6**

- (I) Select the correct answer from given alternatives.
- If  $\log (5x 9) \log (x + 3) = \log 2$  then 1)
  - A) 3
- B) 5
- C) 2
- D) 7
- If  $\log_{10}(\log_{10}(\log_{10}x)) = 0$  then x =2)
  - A) 1000
- B)  $10^{10}$

C) 10

D) 0

- Find x, if  $2\log_2 x = 4$ 
  - A) 4, -4
- B) 4

- C) -4
- D) not defined
- The equation  $\log_{x^2} 16 + \log_{2x} 64 = 3$  has,
  - A) one irrational solution
  - B) no prime solution
  - C) two real solutions
  - D) one integral solution
- 5) If  $f(x) = \frac{1}{1-x}$ , then  $f(f\{f(x)\})$  is

  - A) x 1 B) 1 x C) x
- D) -x

- 6) If  $f: \mathbb{R} \to \mathbb{R}$  is defined by  $f(x) = x^3$  then  $f^{-1}(8)$ is euqal to:
  - A)  $\{2\}$
- B)  $\{-2, 2\}$
- $C)\{-2\}$
- D) (-2.2)
- 7) Let the function f be defined by  $f(x) = \frac{2x+1}{1-3x}$ then  $f^{-1}(x)$  is:
  - A)  $\frac{x-1}{3x+2}$
- B)  $\frac{x+1}{3x-2}$
- C)  $\frac{2x+1}{1-3x}$
- C)  $\frac{3x+2}{x-1}$
- 8) If  $f(x) = 2x^2 + bx + c$  and f(0) = 3 and f(2) = 1, then f(1) is equal to
  - A) -2
- B) 0 C) 1
- D) 2
- 9) The domain of  $\frac{1}{[x]-x}$  where [x] is greatest integer function is
  - A) R
- B) Z
- C) R-Z D)  $Q \{o\}$
- 10) The domain and range of f(x) = 2 |x 5| is
  - A)  $R^+$ ,  $(-\infty, 1]$
- B) R,  $(-\infty, 2]$
- C) R,  $(-\infty, 2)$
- D)  $R^+$ ,  $(-\infty, 2]$

## (II) Answer the following.

- Which of the following relations are functions? If it is a function determine its domain and range.
  - i)  $\{(2, 1), (4, 2), (6, 3), (8, 4), (10, 5), (6, 3), (8, 4), (10, 5), (10$ (12, 6), (14, 7)
  - ii)  $\{(0,0), (1,1), (1,-1), (4,2), (4,-2), (4$ (9, 3), (9, -3), (16, 4), (16, -4)
  - iii)  $\{2, 1\}, (3, 1), (5, 2)\}$
- Find whether following functions are oneone.
  - i)  $f: \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = x^2 + 5$
  - ii)  $f: R-\{3\} \rightarrow R$  defined by  $f(x) = \frac{5x+7}{x-3}$ for  $x \in \mathbb{R} - \{3\}$

- Find whether following functions are onto or not.
  - i)  $f: Z \rightarrow Z$  defined by f(x) = 6x-7 for all
  - ii)  $f: R \rightarrow R$  defined by  $f(x) = x^2 + 3$  for all  $x \in \mathbb{R}$
- 4) Let  $f: R \rightarrow R$  be a function defined by  $f(x) = 5x^3 - 8$  for all  $x \in \mathbb{R}$ , show that f is oneone and onto. Hence find  $f^{-1}$ .
- A function f: R  $\rightarrow$  R defined by  $f(x) = \frac{3x}{5} + 2$ ,  $x \in \mathbb{R}$ . Show that f is one-one and onto. Hence find  $f^{-1}$ .
- 6) A function f is defined as f(x) = 4x+5, for  $-4 \le x < 0$ . Find the values of f(-1), f(-2), f(0), if they exist.
- 7) A function f is defined as : f(x) = 5-x for  $0 \le x \le 4$ . Find the value of x such that (i) f(x) = 3 (ii) f(x) = 5
- 8) If  $f(x) = 3x^4 5x^2 + 7$  find f(x-1).
- 9) If f(x) = 3x + a and f(1) = 7 find a and f(4).
- 10) If  $f(x) = ax^2 + bx + 2$  and f(1) = 3, f(4) = 42, find a and b.
- 11) Find composite of f and g
  - i)  $f = \{(1, 3), (2, 4), (3, 5), (4, 6)\}$  $g = \{(3, 6), (4, 8), (5, 10), (6, 12)\}$
  - ii)  $f = \{(1, 1), (2, 4), (3, 4), (4, 3)\}$  $g = \{(1, 1), (3, 27), (4, 64)\}$
- 12) Find fog and gof
  - i)  $f(x) = x^2 + 5$ , g(x) = x-8
  - ii) f(x) = 3x 2,  $g(x) = x^2$
  - iii)  $f(x) = 256x^4$ ,  $g(x) = \sqrt{x}$
- 13) If  $f(x) = \frac{2x-1}{5x-2}$ ,  $x \neq \frac{5}{2}$

Show that (fof) (x) = x.

- 14) If  $f(x) = \frac{x+3}{4x-5}$ ,  $g(x) = \frac{3+5x}{4x-1}$  then show that  $(f \circ g)(x) = x.$
- 15) Let  $f: R \{2\} \to R$  be defined by  $f(x) = \frac{x^2 4}{x 2}$ and  $g: \mathbb{R} \to \mathbb{R}$  be defined by g(x) = x + 2. Ex whether f = g or not.
- 16) Let  $f: \mathbb{R} \to \mathbb{R}$  be given by f(x) = x + 5 for all  $x \in \mathbb{R}$ . Draw its graph.
- 17) Let  $f: \mathbb{R} \to \mathbb{R}$  be given by  $f(x) = x^3 + 1$  for all  $x \in \mathbb{R}$ . Draw its graph.
- 18) For any base show that  $\log (1+2+3) = \log 1 + \log 2 + \log 3$ .
- 19) Find *x*, if  $x = 3^{3\log_3 2}$
- 20) Show that,  $\log |\sqrt{x^2+1}+x| + \log |\sqrt{x^2+1}-x| = 0$
- 21) Show that,  $\log \frac{a^2}{bc} + \log \frac{b^2}{ca} + \log \frac{c^2}{ab} = 0$
- 22) Simplify,  $\log(\log x^4) \log(\log x)$ .
- 23) Simplify  $\log_{10} \frac{28}{45} - \log_{10} \frac{35}{324} + \log_{10} \frac{325}{432} - \log_{10} \frac{13}{15}$
- 24) If  $\log\left(\frac{a+b}{2}\right) = \frac{1}{2}(\log a + \log b)$ , then show
- 25) If  $b^2$ =ac. prove that,  $\log a + \log c = 2\log b$
- 26) Solve for x,  $\log_{x}(8x-3) \log_{x}4 = 2$
- 27) If  $a^2 + b^2 = 7ab$ , show that,  $\log\left(\frac{a+b}{3}\right) = \frac{1}{2}\log a + \frac{1}{2}\log b$
- 28) If  $\log \left( \frac{x-y}{5} \right) = \frac{1}{2} \log x + \frac{1}{2} \log y$ , show that  $x^2 + y^2 = 27xy$ .

- 29) If  $\log_3 [\log_2(\log_3 x)] = 1$ , show that x = 6561.
- 30) If  $f(x) = \log(1-x)$ ,  $0 \le x < 1$  show that  $f\left(\frac{1}{1+x}\right) = f(1-x) - f(-x)$
- 31) Without using log tables, prove that  $\frac{2}{5} < \log_{10} 3 < \frac{1}{2}$
- 32) Show that

$$7 \log \left(\frac{15}{16}\right) + 6 \log \left(\frac{8}{3}\right) + 5 \log \left(\frac{2}{5}\right) + \log \left(\frac{32}{25}\right)$$
$$= \log 3$$

- 33) Solve:  $\sqrt{\log_2 x^4} + 4\log_4 \sqrt{\frac{2}{x}} = 2$
- 34) Find value of  $\frac{3 + \log_{10} 343}{2 + \frac{1}{2} \log_{10} \left(\frac{49}{4}\right) + \frac{1}{2} \log_{10} \left(\frac{1}{25}\right)}$
- 35) If  $\frac{\log a}{x+v-2z} = \frac{\log b}{v+z-2x} = \frac{\log c}{z+x-2y}$ , show that abc = 1.
- 36) Show that,  $\log_{y} x^{3} \cdot \log_{z} y^{4} \cdot \log_{x} z^{5} = 60$
- 37) If  $\frac{\log_2 a}{4} = \frac{\log_2 b}{6} = \frac{\log_2 c}{3k}$  and  $a^3b^2c = 1$
- 38) If  $a^2 = b^3 = c^4 = d^5$ , show that  $\log_a bcd = \frac{47}{30}$ .
- 39) Solve the following for x, where |x| is modulus function, [x] is greatest interger function,  $\{x\}$  is a fractional part function.

a) 
$$1 < |x - 1| < 4$$
 c)  $|x^2 - x - 6| = x + 2$ 

c) 
$$|x^2 - 9| + |x^2 - 4| = 5$$

d) 
$$-2 < [x] \le 7$$

d) 
$$-2 < [x] \le 7$$
 e)  $2[2x - 5] - 1 = 7$ 

f) 
$$[x^2] - 5[x] + 6 = 0$$

g) 
$$[x-2] + [x+2] + \{x\} = 0$$

$$h) \left[ \frac{x}{2} \right] + \left[ \frac{x}{3} \right] = \frac{5x}{6}$$

40) Find the domain of the following functions.

a) 
$$f(x) = \frac{x^2 + 4x + 4}{x^2 + x - 6}$$

b) 
$$f(x) = \sqrt{x-3} + \frac{1}{\log(5-x)}$$

c) 
$$f(x) = \sqrt{1 - \sqrt{1 - \sqrt{1 - x^2}}}$$

d) 
$$f(x) = x!$$

e) 
$$f(x) = {}^{5-x}P_{x-1}$$

f) 
$$f(x) = \sqrt{x - x^2} + \sqrt{5 - x}$$

g) 
$$f(x) = \sqrt{\log(x^2 - 6x + 6)}$$

41) Find the range of the following functions.

a) 
$$f(x) = |x-5|$$

a) 
$$f(x) = |x-5|$$
 b)  $f(x) = \frac{x}{9+x^2}$ 

c) 
$$f(x) = \frac{1}{1+\sqrt{x}}$$
 d)  $f(x) = [x]-x$ 

$$d) \quad f(x) = [x] - x$$

e) 
$$f(x) = 1 + 2^x + 4^x$$

42) Find 
$$(f \circ g)(x)$$
 and  $(g \circ f)(x)$ 

a) 
$$f(x) = e^x$$
,  $g(x) = \log x$ 

b) 
$$f(x) = \frac{x}{x+1}$$
,  $g(x) = \frac{x}{1-x}$ 

43) Find f(x) if

a) 
$$g(x) = x^2 + x - 2$$
 and  $(g \circ f)(x)$   
=  $4x^2 - 10x + 4$ 

(b) 
$$g(x) = 1 + \sqrt{x}$$
 and  $f[g(x)] = 3 + 2\sqrt{x} + x$ .

44) Find  $(f \circ f)(x)$  if

(a) 
$$f(x) = \frac{x}{\sqrt{1+x^2}}$$

(b) 
$$f(x) = \frac{2x+1}{3x-2}$$
